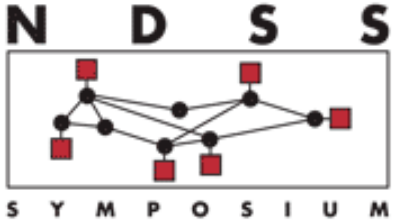
Detecting Passive Content Leaks and Pollution in Android Applications

Yajin Zhou and Xuxian Jiang

North Carolina State University



Apps Are Becoming Popular

initial release

25 billion downloads

675,000 apps

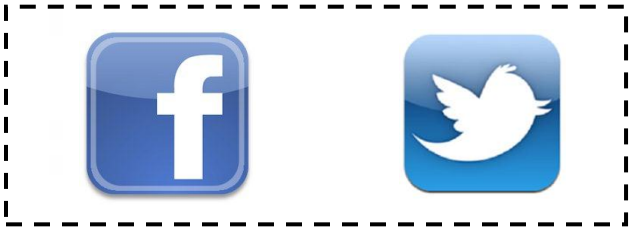
~30 billion downloads

800,000 apps

10/2008 09/2012 02/2013

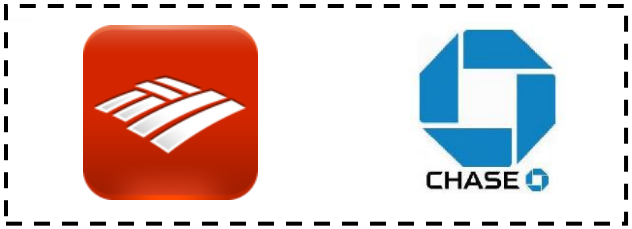
Apps Are Managing User Data

Messages



Friends

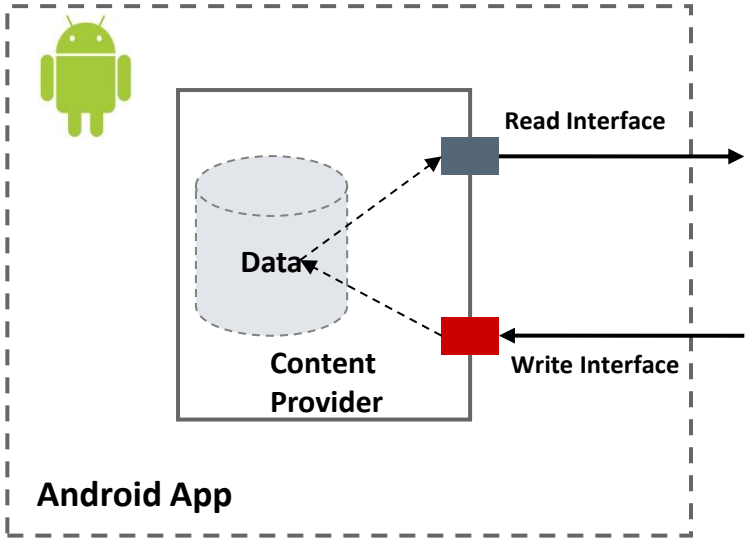
Browser Histories



Bank Accounts

Content Providers

- Manage access to a structured set of data

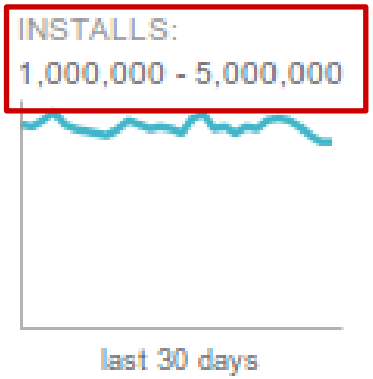


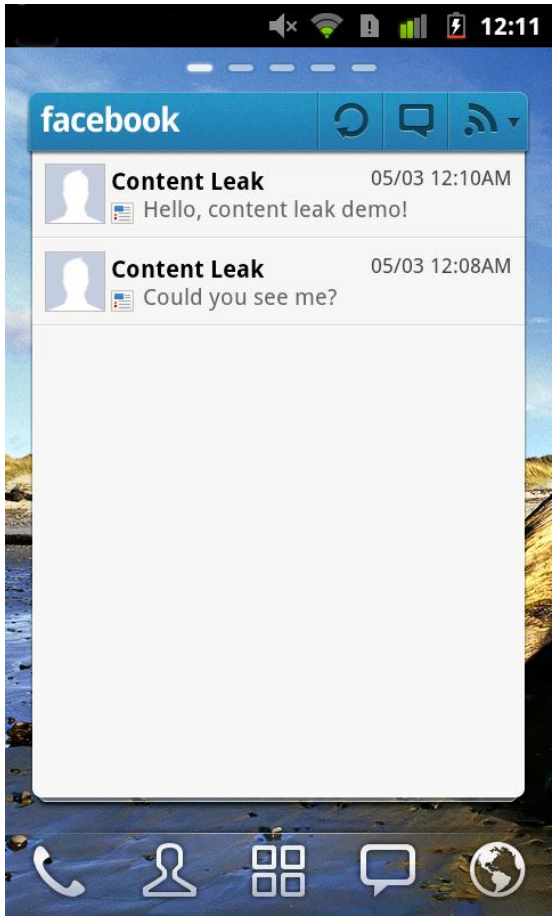
- ***By default*** *are* ***open*** to ***all*** apps on the phone
  (before Android 4.2)

Any potential security risks?

A Motivating Example

- GO FBWidget: popular Android app with more than 1 million installs





A Motivating Example

Computer Science
NC STATE UNIVERSITY

```
final class h implements Facebook.DialogListener {
    public void onComplete(Bundle paramBundle) {
        String token = FaceBookChooserActivity.a(this.a).getAccessToken();
        ContentValues c = new ContentValues();
        c.put("accesstoken", token);
        ContentResolver resolver = this.a.getApplicationContext.getContentResolver();
        resolver.insert(FacebookProvider.SETTING_CONTENT_URI, c);
}
```

get Facebook access token

insert access token into internal database

content provider implementation

```
public class FacebookProvider implements extends ContentProvider {
    public Cursor query(Uri uri, String[] projection, String selection,
                        String[] selectionArgs, String sortOrder) {
        SQLiteDatabase db = this.aq.getWritableDatabase();
        SQLiteQueryBuilder  query = new SQLiteQueryBuilder();
        q.setTables("settings");
        Cursor c = q.query(db, projection, selection, selectionArgs, null, null, sortOrder);
        …
        return c;
    }
}
```

public read interface of content providers

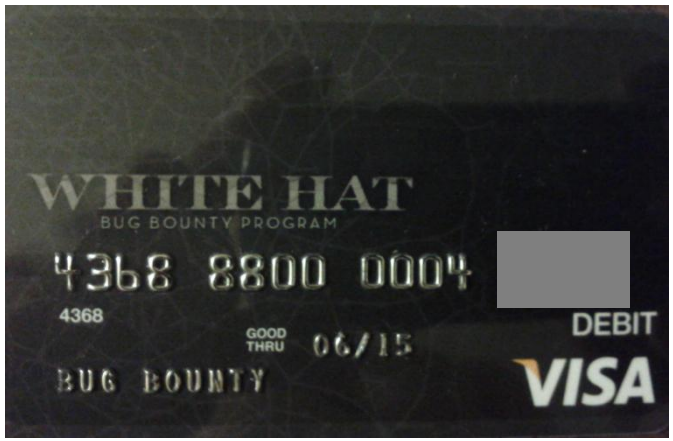
API that actually queries internal database

A Motivating Example

Computer Science
NC STATE UNIVERSITY

- Can be exploited to leak private data
  - ***Access token,*** Facebook posts

Automatically log into user's Facebook account and make posts

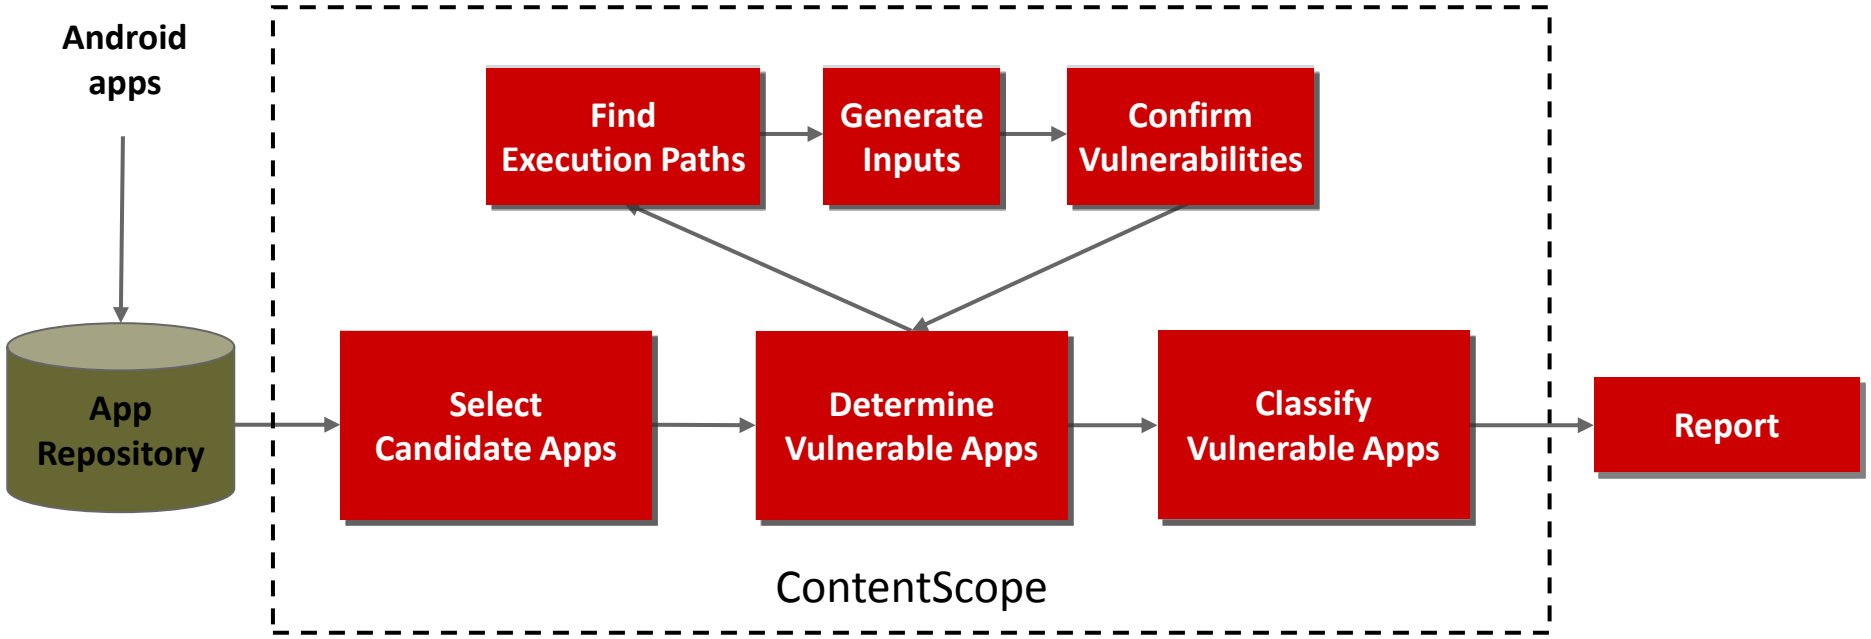


Our Work

Computer Science
NC STATE UNIVERSITY

- Systematically study two vulnerabilities: content leaks and content pollution
  - 2.0% and 1.4% of apps are susceptible, respectively
  - Types of information leaked
    - SMS messages, contacts, user credentials, …
  - Possible side-effects
    - Block SMS messages and phone calls
    - Download apps and prompt for installation

System Design



Find Execution Paths

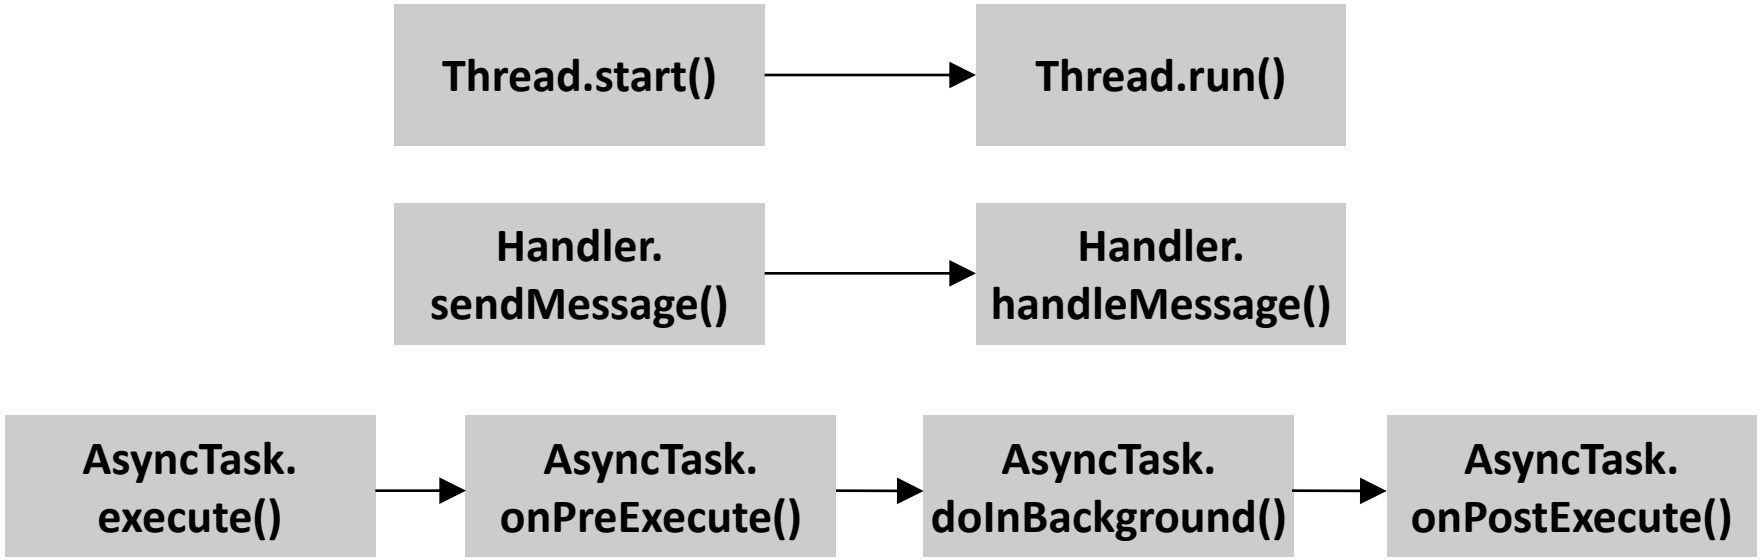
Computer Science
NC STATE UNIVERSITY

- From public interfaces of content providers to functions that actually operate on internal database

Find Execution Paths

Computer Science
NC STATE UNIVERSITY

- Function call graph
  - Object reference resolution
  - Call graph discontinuity



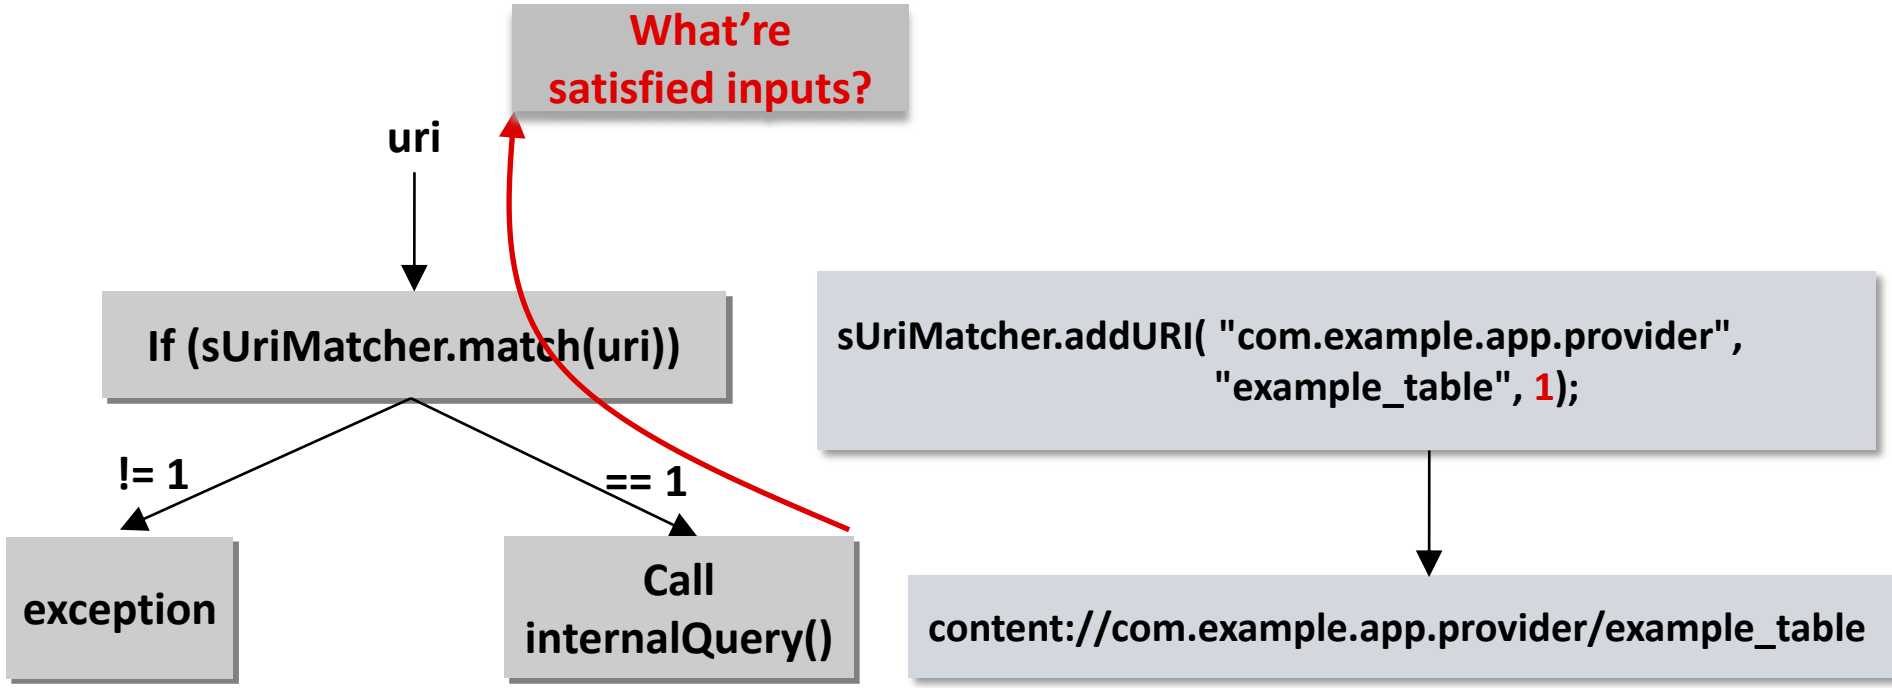
Generate Inputs

Computer Science
NC STATE UNIVERSITY

- Generate control flow graph
- Obtain constraints
- Resolve constraints

Generate Inputs

- Android specific APIs
  - UriMatcher



Confirm Vulnerabilities

Computer Science
NC STATE UNIVERSITY

- Feed generated inputs into a test app
- Invoke public interfaces of content providers
  - query(), insert(), …
- Determine the existence of vulnerabilities based on return value
  - query(): Cursor object
  - insert(): URI object

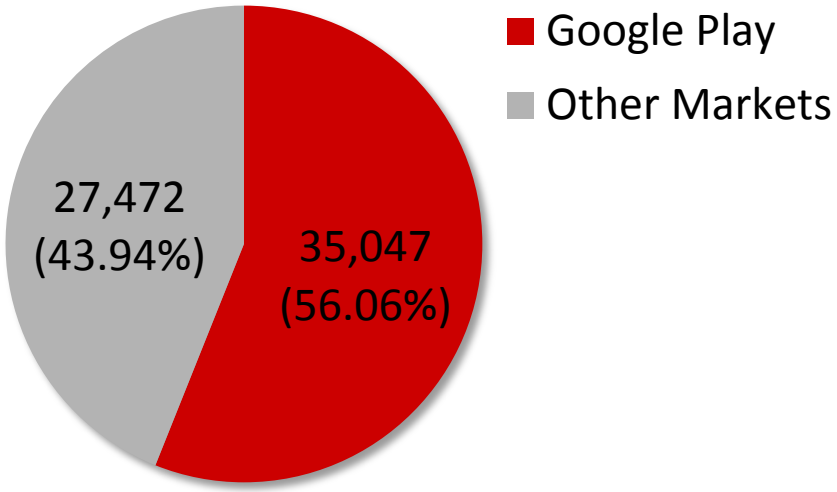
System Implementation

Computer Science
NC STATE UNIVERSITY

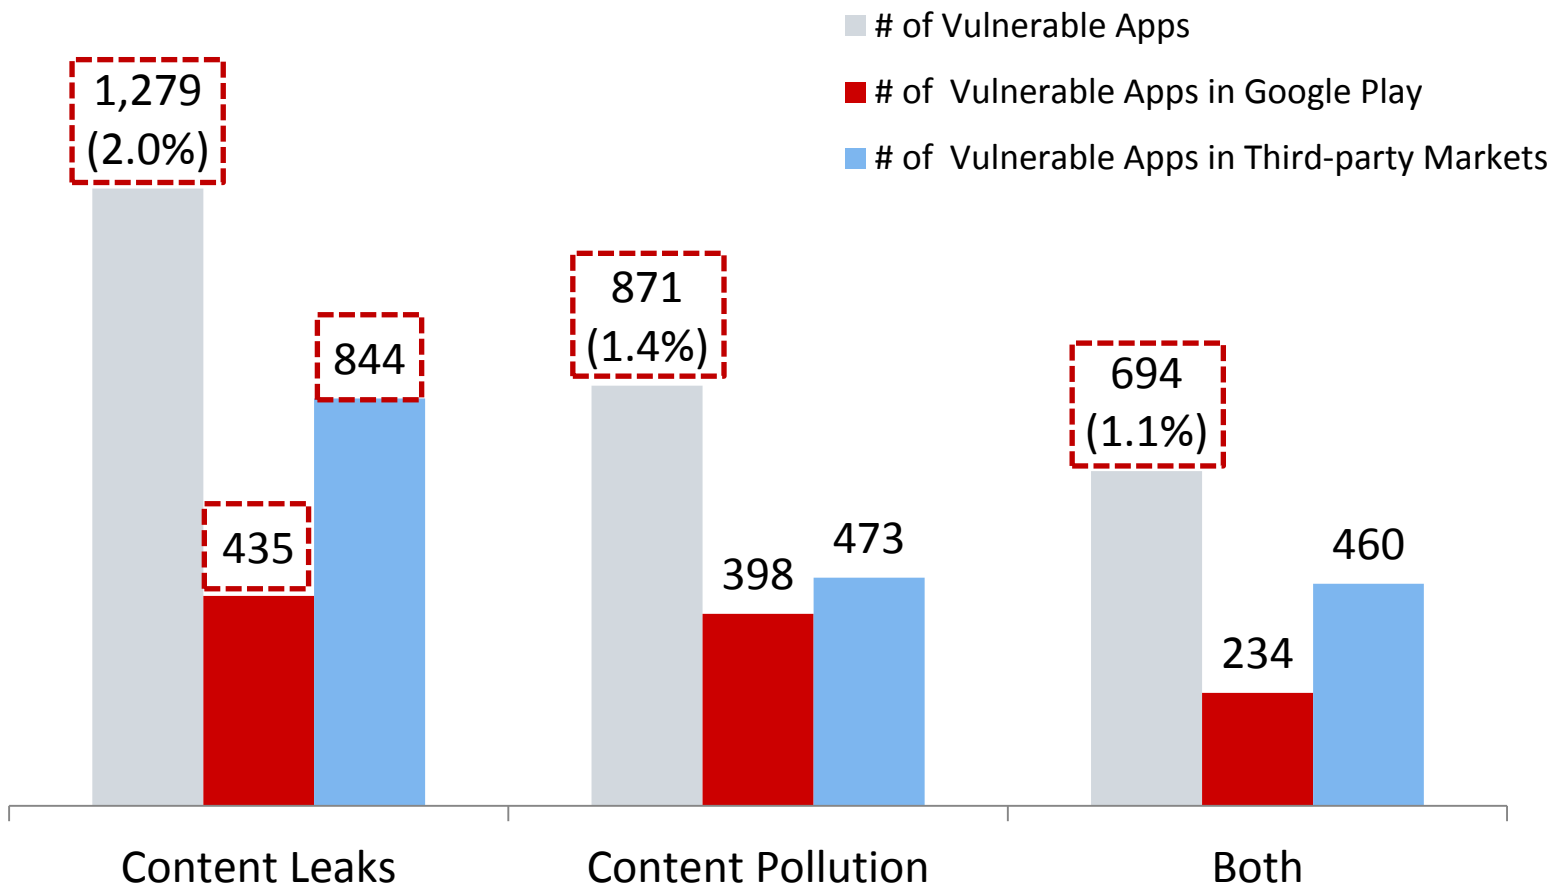
- Around 6,500 SLOCs
- Public interfaces of content providers
  - query(), openFile()
  - insert(), update()
- APIs that actually read or write internal database
  - SQLiteDatabase.query(), SQLiteDatabase.insert(), SQLiteQueryBuilder.query(), …

Evaluation

- Dataset: 62,519 free apps
  - Sources: Google Play and ten other Android markets
  - Time: February 2012



Overall Results



Main Types of Leaked Data

Computer Science
NC STATE UNIVERSITY

Category	# of apps	Representative App	# of Installs
SMS messages	268	Pansi SMS	500,000 – 1,000,000
Contacts	128	mOffice – Outlook sync	100,000 – 500,000
Private information in IM Apps	121	Messenger With You	10,000,000 – 50,000,000
User credentials	80	GO FB Widget	1,000,000 – 5,000,000
Browser History	70	Dolphin Browser HD	10,000,000 – 50,000,000
Call logs	61	Droid Call Filter	100,000 – 500,000
Private information In social network apps	27	Sina Weibo	100,000 – 500,000

Side-effects of Content Pollution

Computer Science
NC STATE UNIVERSITY

- Block SMS messages and phone calls: by manipulating security settings
  - DW Contacts
- Download apps and prompt for installation
  - Baidu Appsearch, Qihoo Browser

Vulnerable Security Apps

Computer Science
NC STATE UNIVERSITY

- Mobile Security Personal Ed.
  - Leak browser histories
- QQPimSecure, Anguanjia
  - Leak SMS, phone call logs
  - Block SMS and phone calls

Possible Mitigations

Computer Science
NC STATE UNIVERSITY

- App Developers
  - Patch their vulnerable apps
- Platform provider (Google)
  - Change the default setting of content provider interface

Possible Mitigations

Computer Science
NC STATE UNIVERSITY

- By Google: content providers are no longer exported by default on Android since 4.2
  - Developers need to **explicitly** change manifest file
    - Set targetSdkVersion to 17 (or higher)
  - Problems remain on old Android versions
    - The API level of ***98.6%*** Android devices are less than 17 on February 04, 2013 [1]

[1] http://developer.android.com/about/dashboards/index.html

Possible Mitigations

- By Google[1] no longer exported nce 4.2
  - Develop e manifest file
    - Set tar
  - Problem
    - The AP s are less than 17 on Feb

Version	Codename	API	Distribution
1.6	Donut	4	0.2%
2.1	Eclair	7	2.2%
2.2	Froyo	8	8.1%
2.3 - 2.3.2	Gingerbread	9	0.2%
2.3.3 - 2.3.7		10	45.4%
3.1	Honeycomb	12	0.3%
3.2		13	1.0%
4.0.3 - 4.0.4	Ice Cream Sandwich	15	29.0%
4.1	Jelly Bean	16	12.2%
4.2		17	1.4%

98.6%
